PROJECT MANAGEMENT

Preface

Project management plays a vital role in today's dynamic and competitive environment, where organizations continuously strive to achieve goals efficiently and effectively. This module is designed to provide learners with a comprehensive understanding of the fundamental principles, tools, and techniques required to successfully manage projects across various contexts.

The course covers the entire project life cycle—from project selection and initiation to planning, execution, monitoring, and closure. It integrates key areas such as stakeholder management, communication, risk management, scheduling, resource allocation, budgeting, procurement, and quality management. Emphasis is placed not only on technical competencies but also on essential interpersonal skills such as leadership, collaboration, and decision-making.

Through structured lessons, practical activities, and real-world applications, learners are encouraged to think critically, solve problems, and apply project management concepts in realistic scenarios. This module aims to equip students with the knowledge and skills necessary to plan, manage, and evaluate projects effectively while adapting to challenges and uncertainties.

Ultimately, this module serves as a foundation for developing competent and responsible project managers who can contribute to organizational success and deliver value through well-managed projects.
